Taint checking? <u>Just say no</u>, according to php developers (I must admit, I stopped reading after first two replies).

<u>Pixy</u> tries to address that (in Java, sic!) and fails on my test code. Only hope left (as it seems) is generation of AST tree using <u>phc</u> or using <u>Parse_Tree</u>. Both look like a workable way to get AST tree, but I really wouldn't like to implement taint analysis for language which I don't particularly like.

Any suggestions from idle readers of my blog?

OOH, this day would be more-or-less complete waste if I didn't stumble upon <u>hypertable</u> which seem like nice implementation of bigtable in sane language (C/C++). Now if I could just find bunch of machines to run it on...
